Discussion problem assignment:

第一题:

Assume $x_1(t)=a_1e^{j\omega_0t}+a_2e^{j2\omega_0t}$ and $x_2(t)=b_1e^{j\omega_0t}+b_2e^{j2\omega_0t}$ where $T=2\pi/\omega_0$. Note that $x_1(t)$ and $x_2(t)$ are both composed of harmonic components ω_0 and $2\omega_0$. For signals $y(t)=x_1(t)+x_2(t)$ and $z(t)=x_1(t)x_2(t)$,

- 1. prove that y(t) and z(t) are still periodic signals with T.
- 2. Write y(t) and z(t) as linear combination of harmonic components. Explain the difference between y(t) and z(t).

$$y(t) = x_1(t) + x_2(t) = (a_1 + b_1)e^{j\omega_0 t} + (a_2 + b_2)e^{j2\omega_0 t}$$

$$z(t) = x_1(t)x_2(t) = \left(a_1e^{j\omega_0t} + a_2e^{j2\omega_0t}\right)\left(b_1e^{j\omega_0t} + b_2e^{j2\omega_0t}\right)$$
$$= a_1b_1e^{j2\omega_0t} + (a_1b_2 + a_2b_1)e^{j3\omega_0t} + a_2b_2e^{j4\omega_0t}$$

$$y(t) = x_1(t) + x_2(t) = (a_1 + b_1)e^{j\omega_0 t} + (a_2 + b_2)e^{j2\omega_0 t}$$

$$z(t) = x_1(t)x_2(t) = \left(a_1e^{j\omega_0t} + a_2e^{j2\omega_0t}\right)\left(b_1e^{j\omega_0t} + b_2e^{j2\omega_0t}\right)$$
$$= a_1b_1e^{j2\omega_0t} + (a_1b_2 + a_2b_1)e^{j3\omega_0t} + a_2b_2e^{j4\omega_0t}$$

重点是,线性组合不会改变谐波成分的频率,但是信号相乘则会。如何解释呢?

所以,我想通过这道题,让大家能够知道,谐波求和不会改变谐波的频率,但是谐波相乘却很容易

第二题:复数的开方运算

已知复数X有 $X^4 = 1$,求X的取值。

A: X的取值有四个,+1,-1,+j,-j。

$$X = e^{j\frac{2\pi}{4}m}, \quad m = 0, 1, 2, 3$$

$$= 1, e^{j\frac{\pi}{2}}, e^{j\frac{2\pi}{2}}, e^{j\frac{3\pi}{2}}$$

$$= 1, j, -1, -j$$

$$X = e^{j\frac{2\pi}{4}m}, \quad m = 0, 1, 2, 3$$

$$= 1, e^{j\frac{\pi}{2}}, e^{j\frac{2\pi}{2}}, e^{j\frac{3\pi}{2}}$$

$$= 1, j, -1, -j$$

已知复数X有 $X^4 = -1$,求X的取值。

$$X^{4} = -1 = e^{j\pi}$$

$$X = e^{j\frac{\pi + 2\pi m}{4}}, \quad m = 0,1,2,3$$

$$= e^{j\frac{\pi}{4}}, e^{j\frac{3\pi}{4}}, e^{j\frac{5\pi}{4}}, e^{j\frac{7\pi}{4}}$$

$$X^{4} = -1 = e^{j\pi}$$

$$X = e^{j\frac{\pi + 2\pi m}{4}}, \quad m = 0,1,2,3$$

$$= e^{j\frac{\pi}{4}}, e^{j\frac{3\pi}{4}}, e^{j\frac{5\pi}{4}}, e^{j\frac{7\pi}{4}}$$

强调复数的开方运算,得到的结果可能并不唯一。尤其是当高次开方,如 $X^{100}=+1$,可以想象开方后的可能 X 值有 100 个,是非常多的,甚至可以看成是不确定的。

尤其是 $e^{j2\pi t}=\left(e^{j2\pi}\right)^t=1^t$,当 t 的取值是小数值,如 t=0.001, $1^{0.001}$ 是不确定的。而离散时间信号有 $e^{j2\pi n}=1$ 。

$$X^{N}=Ae^{j\theta}$$

$$X=\sqrt[N]{A}e^{j\frac{\theta+2\pi m}{N}}, \quad m=0,1,\cdots,N-1, \quad [0,2\pi)$$

$$-\sqrt[N]{N}, \quad X^{N}=Ae^{j(\theta+2\pi m)}=Ae^{j\theta}$$

$$X=\sqrt[N]{A}e^{j\frac{\theta+2\pi m}{N}}, \quad m=0,1,\cdots,N-1, \quad [0,2\pi)$$

$$X^{N}=Ae^{j(\theta+2\pi m)}=Ae^{j\theta}$$

N次开方,在[0,2pi)一周内有N个根。

幅度开方,与普通的开方相同。

但是,相位的开方,是[0,2pi)一周内等相位间隔分布的 N 个相位。相位间隔是 2pi/N
